## Curs 8

## Programare liniară

Pregateri

Obs Fie  $\nabla = (V_1, V_2, V_3)$  $\overline{W} = (W_1, W_2, W_3)$ 

doi vect din 183

\$(J, w) = arccos < < v, ~> (Lo, 11)

(am foloset cos (4(v,v))= 4v,v> [1,1]

< V, W>= ~, ~, +~2~~ + ~3~~3; ||v||= V< v, V>

Obs Pt a mösura unghiul dintre directia date se sete este sufficient so calculant so maneuram unghiul d'intre directia dato si normalele "le sete (un ved normal la plan este un nect perpendecular pe plan, de normà 1).

Condetea ca o motreto so blochezer respectivos so pur blocheze extragerca intr-o denedre deta

fajor (1 a montréle? ce coresponde leter f1 a piese?. Notains en 50(f1) normala extersoorà la fajor f1

in directed delunghior dentre d si P(fi) este <90°(=) (=) cos(\*(d,D(fi))>0

In denedra Jan X (J. I) (II)) 290 => cos (X (J, I) (P2)) 50

Détalgene - conditra scrissi in coordonnée

Fir.g. pp. co d = (dx,dy,1)

( a da a dir n'm sus" este echevdent

en a alege un punct din planul Z=1)

Fie fo față fixată,  $\mathcal{P}(f) = (\mathcal{P}_{x}, \mathcal{P}_{y}, \mathcal{P}_{z})$ A găsi o directie d = (dx,dy,1) pt care să

nu blocheze (=> <  $\mathcal{P}(f)$ ,d> <0(=)

Px.dx + Py dy + P250 (xs)

Solo P (ad9co Px, Py, P2) -> dolo

Sont coutofi dx, dy care so vf. rel (xs)

(xg): inecuatre ce descrie un semaplon

Exp

Sem: plane s? intersection

Exp Legatora dentre normalà, extragerea objectulus se sesteme de inecuation

2(0): (0,-1,1); (0,1,1); (0,1,0); (0,0,-1); (0,-1,0) -> d?rector pt normale

f. teorse (succ de top xs)
